

TRANSFORMING HULK

instructions

Carefully fill tank to dashed line with luke warm tap water through the water port.

Carefully dry outside of tank with a clean towel if water has spilled on the surface.

Empty tank of water, and the HULK will turn to His approximate original size. He will grow again when water is added to the tank.

Within 24-48 hours, the HULK will crack his way through the chamber.

The HULK will take up to 5 days to fully grow!

With the use of a long utensil through the water port, carefully move chamber pieces away from the HULK if growth is impeded.
